

# Size comparison of the three common ukuleles

These full size diagrams show the distance between the nut and the 12th fret of the three common ukulele sizes. The 12th fret is exactly midway between the nut and the bridge saddle and as such marks one half of the vibrating string length. As the string length determines the fret positions, the shorter the string length, the closer the frets are to each other.

*NB Different manufacturers use slightly different string lengths so the dimensions given here may be very slightly different to your ukulele.*
